PowerOn: A Complete Tool to Power Episys for Credit Unions

The marketplace is changing quickly. These changes often require core platform customization. Circumstances dictate that flexibility is the key to success in providing core processing services. The use of open, common programming protocols enables maximum flexibility for changes.

Symitar, Synergent's core processing partner, takes this technological challenge very seriously, and they have created a tool that both Synergent programmers and credit union IT departments can use. Synergent uses this tool, called PowerOn, allowing control to be placed directly in the hands of credit unions. We can modify your Episys core processing systems in a multitude of ways.

We can, for example, design and create data screens, create user-defined inquiries for reporting, and upload data files and thus build interfaces with other systems and integrate data from multiple sources. These changes are made within the structure and protection of the core system, but independent of the core code.

This programming with Synergent support will give credit unions maximum freedom to adapt the core platform to your requirements. Most of the customization created with PowerOn falls into one of six areas:

- Reporting
- File Maintenance
- Data integration
- Peripheral integration
- Data entry and transaction validation
- Email generation

"PowerOn gives credit unions the unique ability to customize their experience when using the Episys core. If a specific task is found to be cumbersome or time consuming, such as writing a report or gathering data for multiple areas in the core, a PowerOn can almost always be implemented to streamline the process. PowerOn programs ultimately net credit unions with countless hours of time from the efficiencies gained through their deployment."

- **Nick Chasse**

What this software does:

- Supports the development of user defined queries and inquiry screens
- Supports the on-demand generation of custom reports, forms, and member correspondence
- Enables validation of data entry

What this software does for you with Synergent's programing support:

- Maximizes the functionality and flexibility of Episys
- Expedites responses to member and market demands
- Reduces operating costs and labor requirements

The Synergent programming team has created an HTML Account Summary page that is included with ID scanning and modules that enable credit unions to have a program that functions like overdraft protection. Other PowerOn programs include highly customizing an Account Cross Sell module, implementing reward checking programs at our data center, and programming batch interfaces for ALM programs or general ledgers.
